Airborne Magnetometers detect the change in the Earth's magnetic field using sensors attached to the aircraft in the form of a "stinger" or by towing a magnetometer on the end of a cable. The magnetometer on a cable is often referred to as a "bomb" because of its shape.

Magnetometer - Wikipedia

Magnetometers refer to sensors used for sensing magnetic fields OR to systems which measure magnetic field using one or more sensors. Since magnetic flux density in air is directly proportional to magnetic field strength, a magnetometer is capable of detecting

The magnetometer sensor (seen here on an Android phone) is crucial for detecting the orientation of your device relative to the Earth's magnetic north. The magnetometer readings are reported in micro Tesla units (μT).

Magnetometer in Smartphones and Tablets

The range of magnetometers based on piezoelectric resonator is a few nT (nanoTesla). Advantages of MEMS-based sensors. A MEMS-based magnetic field sensor is small, so it can be placed close to the measurement location and thereby achieve higher spatial resolution than other magnetic field sensors.

The output of the sensor can range (roughly) from 0 to 5V, and it is 2.5V when no magnetic field is applied. The sensor output can range $\pm 2.5V$ from its value when no field is applied, so the sensor can measure magnetic fields of $\pm 2.5V \cdot (1\text{Gauss}/0.005V) = \pm 500 \text{ Gauss}$. At the extreme ends of this range, the sensor is likely not too linear.
