The digital image processing deals with developing a digital system that performs operations on an digital image. What is an Image. An image is nothing more than a two dimensional signal. It is defined by the mathematical function $f(x,y)$ where x and y are the two co-ordinates horizontally and vertically.

Digital image processing is the use of a digital computer to process digital images through an algorithm. As a subcategory or field of digital signal processing, digital image processing has many advantages over analog image processing. It allows a much wider range of algorithms to be applied to the input data and can avoid problems such as the build-up of noise and distortion during processing.

Digital Image Processing MODULE 1 By Shyno K G (Asst. Professor, Dept. Of ECE) KTUNOTES.IN Downloaded from Ktunotes.in. Introduction Image Image $f(x,y)$ is a projection of a 3D scene to a 2D projection plane. An analog image is characterized by physical magnitude varying continuously in space.

Digital Image Processing MODULE 1 - KTU NOTES

Digital image processing techniques help in manipulation of the digital images by using computers. The three general phases that all types of data have to undergo while using digital technique are pre-processing, enhancement, and display, information extraction.

Digital Image Processing |authorSTREAM

Digital image processing has many advantages as compared to analog image processing. Wide range of algorithms can be applied to input data which can avoid problems such as noise and signal distortion during processing. As we know, images are defined in two dimensions, so DIP can be modeled in multidimensional systems. ...
